Overview

Problem Definition

Outlying Aspects Mining

Outlying Aspects Mining aims to identify the outstanding features of the query object.

Defin

- A teacher may be interested in the characteristics that make one student distinctive from others.
- NBA coaches would prefer to find out the strengths and weaknesses of the player (a query object).

Player	3PT%	FTA	FT%	То
P_1	65	4	33	8
P_2	78	1	65	5
P_3	58	6	46	3
P_4	68	1.2	85	6.2
P_5	58	6.2	36	3.4

Outlying Aspects Mining vs Outlier Detection

Player	3PT%	FTA	FT%	То
P_1	65	4	33	8
P_2	78	1	65	5
P_3	58	6	46	3
P_4	68	1.2	85	6.2
P_5	58	6.2	36	3.4

Outlying Aspects Mining

- Explain the distinctive aspects of the query object.
- The query object may (or may not) be an outlier.

Outlier Detection

- Find out all unusual objects in the whole dataset.
- No explanation on how they are different.

Group Outlying Aspects Mining

Group outlying aspects mining aims to identify the outstanding features of the group of query object.

-)efn
- Doctors desire to identify the merits & demerits between a group of cancer patients and normal people.
- NBA coaches are passionate about exploring the obvious advantages & disadvantages of the team.

Figure 1: Medical

Figure 2: NBA-Team

Problem Formalization

Group outlying aspects mining aims to identify the top-k group outlying subspace $s \subseteq F$ in which the query group G_q is distinctive with other groups.

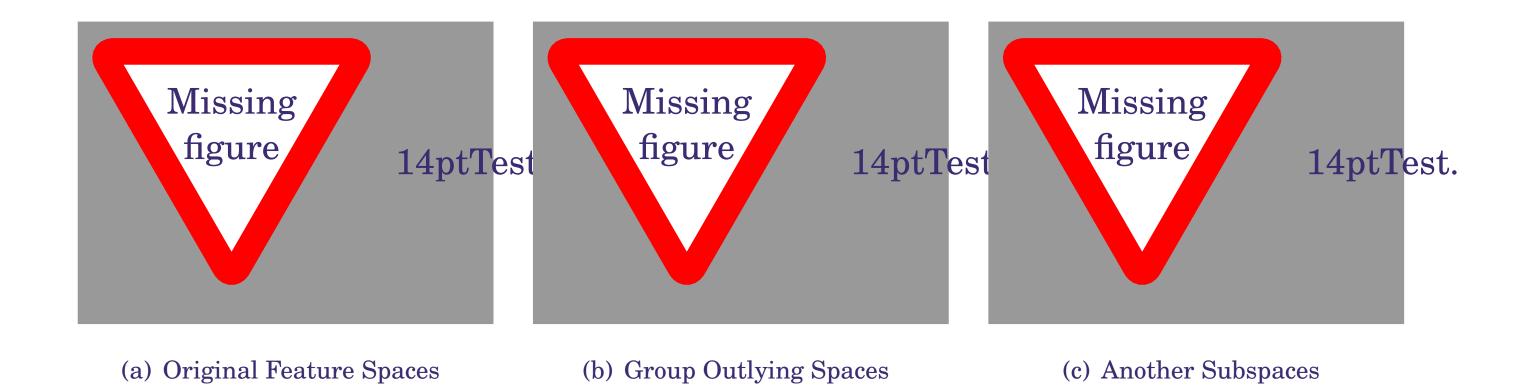

)efn

- $G = \{G_q, G_2, G_3, ..., G_n\} \Leftrightarrow \text{a set of groups.}$
- $G_q \Leftrightarrow \text{the query group.}$
- \blacksquare Other groups \Leftrightarrow comparison groups.
- Each object in the group has d features $F = \{f_1, f_2, ..., f_d\}$.

Term Definition

- Top-k group outlying subspaces
 - $\rho_s(\cdot) \Rightarrow$ outlying scoring function.
 - $lacklosspace
 ho_s(\cdot)$ quantifies the outlying degree of the query group G_q in the subspace s.
 - Order by DESC using scoring function $\rho(\cdot)$ to identify top K group outlying subspaces.

Term Definition

- Trivial Outlying Features
 - ◆ One-dimension subspaces.
 - G_q 's outlying degree $\rho(\cdot) > \alpha$.

Table 1: $\alpha = 4$

Feature	Outlying Degree
$\{\pmb{F}_1\}$	4.351
$\{\pmb{F}_3,\pmb{F}_4\}$	4.024
$\{\pmb{F}_2,\pmb{F}_4\}$	2.318
$\{\pmb{F}_2\}$	2.002
$\{\pmb{F}_3\}$	1.028

Term Definition

- Non-Trivial Outlying Subspaces
 - ◆ Multi-dimension subspaces.
 - G_q 's outlying degree $\rho(\cdot) > \alpha$.

Table 2: $\alpha = 4$

Feature	Outlying Degree
$\{\pmb{F}_1\}$	4.351
$\{\pmb{F}_3, \pmb{F}_4\}$	4.024
$\{\pmb{F}_2,\pmb{F}_4\}$	2.318
$\{\pmb{F}_2\}$	2.002
$\{\pmb{F}_3\}$	1.028

Related Work and Challenges

Related Work - Outlying Aspects Mining

- Existing Methods Feature selection
 - ◆ To distinguish two classes: the query point (positive) & rest of data (negative)

Disadvantages

- Positive and negative classes are
 Not balanced.
- Not quantify the outlying degree accurately.
- Not identify group outlying aspects.

Advantages

- ◆ Easy to operate.
- Resolve dimensionality bias.

Related Work - Outlying Aspects Mining

- Existing Methods Score-and-search
 - ◆ Define an outlying score function.
 - Search subspaces.

Disadvantages

- Dimensionality bias.
- Search efficiency is Not high (dataset is large).
- Not identify group outlying aspects.

Advantages

- Quantify the outlying degree correctly.
- High Comprehensibility.

Group Outlying Aspects Mining

- Focus on differences between groups.
- Multiple points.

Outlying Aspects Mining

- Concentrates on differences between objects.
- One point.

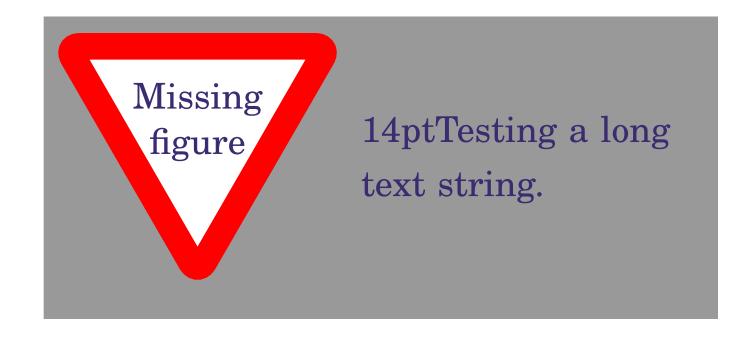

Figure 3: Group Outlying Aspects Target

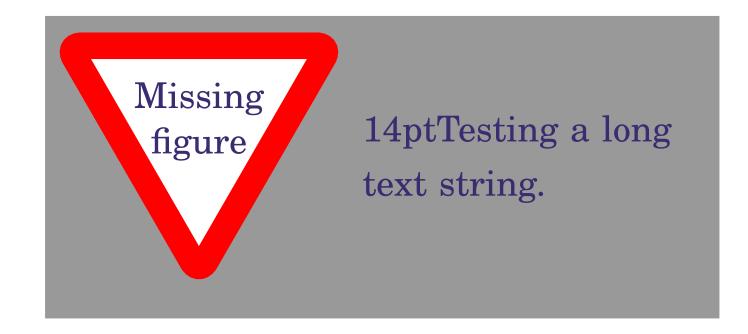

Figure 4: Outlying Aspects Target

Challenges (1)

- How to represent the group features.
 - Can be affected by outlier values.
 - ◆ Can Not reflect the overall distribution of group features.

Challenges (2)

- How to evaluate the outlying degree in different aspects.
 - ◆ Need design a scoring function when necessary.
 - Adopting an appropriate scoring function (without dimension bias) remains a problem.

Challenges (3)

- How to improve the efficiency.
 - ◆ When the dimension of the data is high, the candidate subspace grows exponentially.
 - ◆ It will easily go beyond the limits of the computation resources.

GOAM Algorithm

Framework of GOAM algorithm:

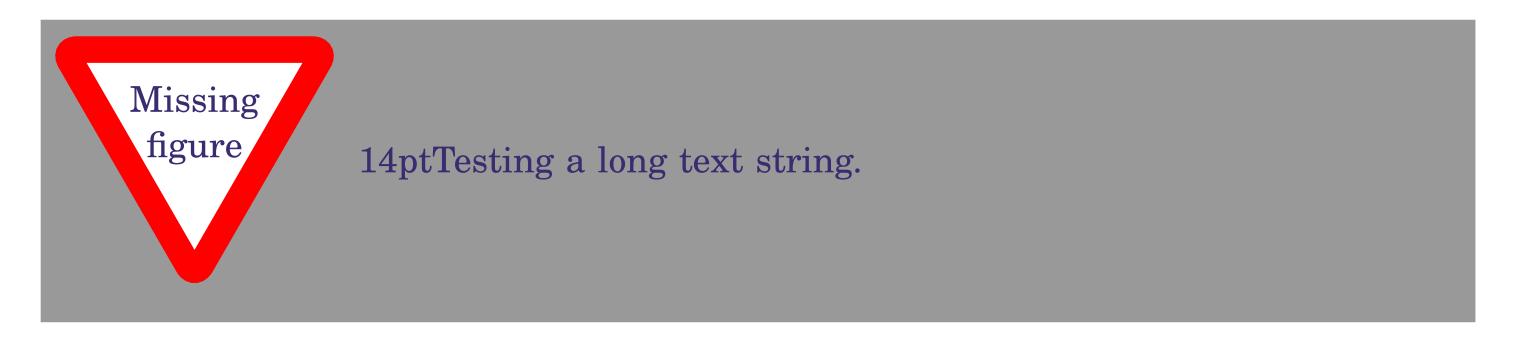

Figure 5: Framework of GOAM Algorithm

Step One - Group Feature Extraction

Suppose f_1 , f_2 , f_3 are three features of G_q .

 f_1 : { $x_1, x_2, x_3, x_4, x_5, x_2, x_3, x_4, x_1, x_2$ }

 f_2 : { $y_2, y_2, y_1, y_2, y_3, y_3, y_5, y_4, y_4, y_2$ }

 f_3 : { $z_1, z_4, z_2, z_4, z_5, z_3, z_1, z_2, z_4, z_2$ }

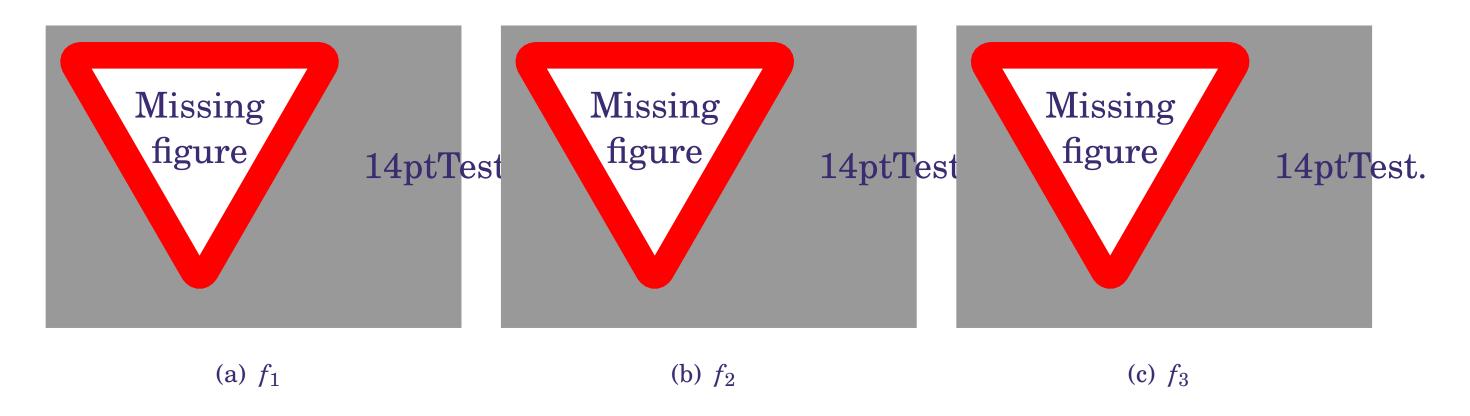

Figure 6: Histogram of G_q on three features

Step Two - Outlying Degree Scoring

- Calculate Earth Mover Distance
 - Represent one feature among different groups
 - ◆ Purpose: calculate the minimum mean distance

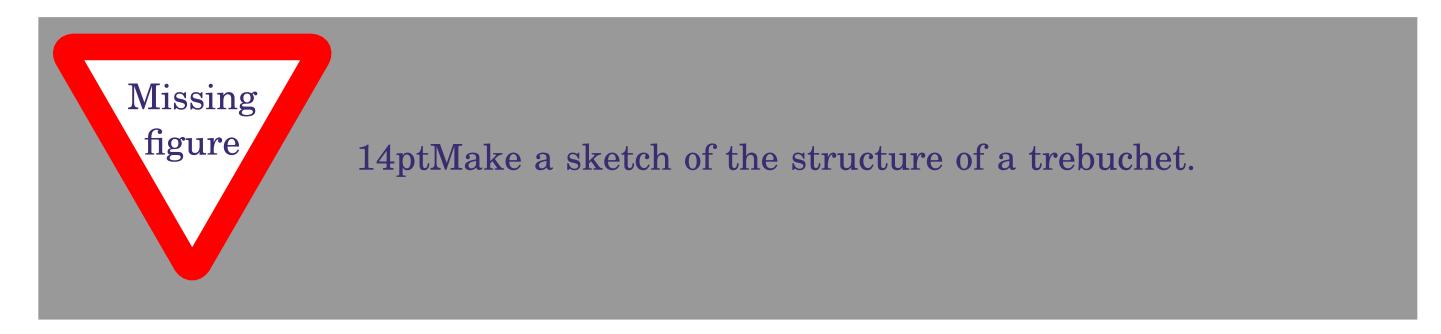

Figure 7: EMD of one feature

Step Two - Outlying Degree Scoring

Calculate the outlying degree

$$OD(G_q) = \sum_{1}^{n} EDM(h_{q_s}, h_{k_s})$$

- \bullet n \Leftrightarrow the number of contrast groups.
- $h_{k_s} \Leftrightarrow$ the histogram representation of G_k in the subspace s.

Step Three - Outlying Aspects Identification

- Identify group outlying aspects mining based on the value of outlying degree.
- The greater the outlying degree is, the more likely it is group outlying aspect.

Pseudo code

Pseudo code of GOAM algorithm

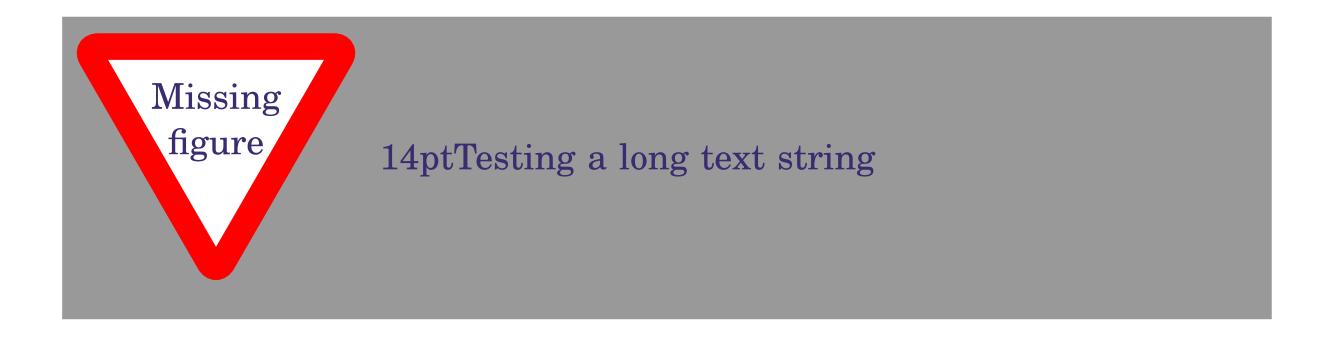

Table 3: Original Dataset

G_1	F_1	F_2	F_3	F_4	G_2	F_1	F_2	F_3	F_4
	10	8	9	8		7	7	6	6
	9	9	7	9		8	9	9	8
	8	10	8	8		6	7	8	9
	8	8	6	7		7	7	7	8
	9	9	9	8		8	6	6	7
G_3	F_1	F_2	F_3	F_4	$ig G_4$	F_1	F_2	F_3	F_4
	8	10	8	8		9	8	8	8
	9	9	7	9		7	7	7	9
	10	9	10	7		8	6	6	8
	9	10	8	6		9	8	8	7
	9	9	7	9		8	7	9	8

Illustration

Table 4: outlying degree of each possible subspaces

Feature	Outlying Degree	Feature	Outlying Degree
$\{\pmb{F}_1\}$	4.351	$\{\pmb{F}_2,\pmb{F}_3\}$	4.023
$\{\pmb{F}_2\}$	2.012	$\{\pmb{F}_3,\pmb{F}_4\}$	4.324
$\{\pmb{F}_3\}$	1.392	$\{\pmb{F}_2,\pmb{F}_4\}$	2.018
$\{\pmb{F}_4\}$	2.207	$\{F_2, F_3, F_4\}$	2.012

Search process:

$$OD(\{F_1\}) > \alpha$$
, save to T_1 .

$$OD({F_2}) < \alpha$$
, save to C_1 .

$$OD({F_3}) < \alpha$$
, save to C_2 .

$$OD({F_4}) < \alpha$$
, save to C_3 .

$$OD(\{F_2, F_3\}) > \alpha$$
, save to N_1 .

$$OD(\{F_3, F_4\}) > \alpha$$
, save to N_2 .

$$OD({F_2,F_4}) < \alpha$$
, remove.

$$OD(\{F_2, F_3, F_4\}) < \alpha$$
, remove.

Strengths of GOAM Algorithm

- Reduction of Complexity
 - ◆ Bottom-up search strategy.
 - ◆ Reduce the size of candidate subspaces.
- Efficiency

lacktriangle Before: $O(2^d)$

Now: $O(d * n^2)$

Evaluation Results

Evaluation

 $Accuracy = \frac{P}{T}$

P: Identified outlying aspects

T: Real outlying aspects

Synthetic Dataset

Synthetic Dataset and Ground Truth

Table 9: The identified outlying aspects of groups

Teams	Trivial Outlying Aspects	NonTrivial Outlying Aspects
Cleveland Cavaliers	{3FA}	{FGA, FT%}, {FGA, FG%}
Orlando Magic	{Stl}	None
Milwaukee Bucks	{To}, {FTA}	{FGA, FTA}, {3FA, FTA}
Golden State Warriors	$\{FG\%\}$	{FT%, Blk}, {FGA, 3PT%, FTA}
Utah Jazz	${Blk}$	{3FA, 3PT%}
New Orleans Pelicans	{FT%}, {FTA}	{FTA, Stl}, {FTA, To}

Conclusion

Conclusion

- Formalize the problem of *Group Outlying Aspects Mining* by extending outlying aspects mining;
- Propose a novel method GOAM algorithm to solve the *Group Outlying Aspects Mining* problem;
- Utilize the pruning strategies to reduce time complexity.
